GovFlow AI

A One-Stop Intelligent Citizen Service Platform for Sri Lanka

Young Protégé Project Idea

Introduction

Accessing government services in Sri Lanka can be a frustrating and time-consuming experience. Citizens often need to search multiple government websites, visit different departments, read lengthy documents, and rely on unofficial sources to understand procedures for services such as obtaining a National Identity Card (NIC), renewing a passport, applying for a driving license, registering a business, or registering for marriage.

Although information is publicly available, it is fragmented across different government institutions and presented in a way that is difficult for ordinary citizens to follow.

GovFlow AI aims to solve this problem by providing a single intelligent platform that guides citizens through government procedures from start to finish.

Problem Statement

Current government digital services primarily focus on publishing information rather than helping citizens complete government procedures.

Some of the key problems include:

- Information is scattered across multiple government websites.
- Citizens often do not know which government department they need.
- Government procedures are complex and difficult to understand.
- Missing documents often results in multiple visits to government offices.
- Existing government chatbots only answer questions instead of guiding users through the complete process.

There is currently no centralized platform that provides personalized guidance for multiple government services in Sri Lanka.

Problem Statement

GovFlow AI is an AI-powered citizen service platform that acts as a one-stop solution for accessing government services.

Instead of simply providing information, the platform helps citizens complete government procedures through personalized workflows.

Users simply describe what they want to accomplish.

For example:

- I want to renew my passport.
- I need my first NIC.
- I want to register for my business.
- I want to apply for a driving license.

The platform then:

- Understands the user's objective using AI.
- Asks relevant follow-up questions.
- Retrieves official information from trusted government sources.
- Generates a personalized step-by-step workflow.
- Displays required documents, estimated costs, and processing times.
- Tracks the user's progress until the process is completed.

Example Scenario

A user enters:

"I want to register a business."

Instead of displaying a long list of instructions, GovFlow AI asks a few questions such as:

- What type of business?
- How many owners?
- Which district?

The platform then generates a personalized roadmap showing:

- Step-by-step tasks
- Required documents
- Government departments to visit
- Downloadable forms
- Estimated fees
- Processing time
- Progress checklist

The user can complete each step while tracking their overall progress.

Key Features

- One-stop platform for multiple government services
- AI-powered citizen assistant
- Personalized workflow generation
- Interactive progress tracking
- Digital document wallet
- AI-based document validation
- Government knowledge base using official information
- Smart recommendations for related government services

Expected Benefits

For Citizens

- Easier access to government services.
- Reduced time spent searching for information.
- Personalized guidance based on individual needs.
- Fewer unnecessary visits to government offices.
- Better understanding of government procedures.

For Government

- Reduced repetitive public inquiries.
- Improved citizen satisfaction.
- Increased adoption of digital government services.

Proposed Technology Stack

- **Frontend:** Next.js, React
- **Backend:** FastAPI/NodeJS
- **Database:** PostgreSQL
- **AI:** OpenAI API / LangGraph / LangChain
- **Knowledge Base:** Retrieval-Augmented Generation (RAG)
- **Document Processing:** OCR (Tesseract)
- **Deployment:** Docker

Innovation

Unlike existing government websites or AI chatbots that mainly provide information, GovFlow AI focuses on helping citizens complete government procedures through personalized workflows, intelligent decision support, document management, and progress tracking.

The platform transforms complex government procedures into simple, interactive, and user-friendly experiences, making government services more accessible and efficient.

Conclusion

GovFlow AI aims to become the **single digital gateway for Sri Lankan government services**, enabling citizens to complete government procedures more efficiently through AI-powered guidance and workflow management. By combining official government information with personalized recommendations, document validation, and progress tracking, the platform provides a smarter and more practical alternative to existing government portals and information systems.
